

Hardware Components

Parts required to build the system described in the accompanying write-up:

Raspberry Pi 5

4GB or 8GB RAM. The main processing unit; runs Linux and hosts the agent.

Official USB-C power supply

5V/5A, 27W. The Pi 5's power draw requires this exact spec; underpowering causes instability and corruption.

microSD card

32GB or larger, Class 10/A2. Stores the OS, applications, and files.

USB microphone

Voice capture and wake-word detection.

USB speaker

Spoken output. USB rather than 3.5mm, since the Pi 5 has no analog audio jack.

Case with active cooling

Fan or heatsink. Sustained AI workloads run the Pi 5 hot.

Display, keyboard, and mouse

Optional — needed only for initial setup or standard-mode use. A micro-HDMI to HDMI cable or adapter is required if a monitor is used.
